Magfield Recycling Magnet

The Magfield Recycling Magnet was designed specifically for the separation of steel cans from a refuse conveyor.

After consultation with B.H.P. and The Steel Can Group it was apparent that the magnetic separators used in other industries were too cumbersome and too expensive for the recycling industry.

The Magfield Recycling Magnet is a permanent magnet and will never lose its magnetic strength. The cleated belt is driven by a Joki Drum Motor which can be 415V or 230V. These magnets have been available since 1993 and have been supplied to recycling plants all over Australia and New Zealand.
